

Advanced drainage solutions for constrained environments.

Delivering surface water management where excavation is limited. Our award-winning solutions enable active travel routes through sensitive landscapes and restricted sites, overcoming constraints of conventional drainage.

System Overview:

- Porous modular drainage units are made from recycled tyre rubber using cold-cure encapsulation
- Reduced excavation provides a simple application to construct pathway frameworks and edges
- Reducing carbon footprint by up to 50%
- Water is managed away from the path surface using spurs and integrated natural soakaways
- Dispersing surface water and preventing waterlogging and erosion
- A low maintenance solution for year-round usage and active travel
- Delivering long-term social, environmental and economic benefits

It's a sustainable, and easy to install solution that improves public access and reduces excavation, carbon and environmental impact.
